The information in this report is considered confidential and proprietary by Resonance and is licensed to the recipient solely under the terms of the project statement of work. Reproduction or distribution, in whole or in part, is strictly prohibited without the express written permission of Resonance.

All activities performed by Resonance in connection with this project were carried out in accordance with the project statement of work and agreed-upon project plan. It's important to note that security assessments are time-limited and may depend on information provided by the client, its affiliates, or partners. As such, the findings documented in this report should not be considered a comprehensive list of all security issues, flaws, or defects in the target system or codebase.

Furthermore, it is hereby assumed that all of the risks in electing not to remedy the security issues identified henceforth are sole responsibility of the respective client. The acknowledgement and understanding of the risks which may arise due to failure to remedy the described security issues, waives and releases any claims against Resonance, now known or hereafter known, on account of damage or financial loss.

Executive Summary

Hemi contracted the services of Resonance to conduct a comprehensive security audit of their smart contracts between 14th April, 2025 and 16th April, 2025. The primary objective of the assessment was to identify any potential security vulnerabilities and ensure the correct functioning of smart contract operations.

During the engagement, Resonance allocated 2 engineers to perform the security review. The engineers, including an accomplished professional with extensive proficiency in blockchain and smart-contract security, encompassing specialized skills in advanced penetration testing, and in-depth knowledge of multiple blockchain protocols, devoted 3 days to the project. The project's test targets, overview, and coverage details are available throughout the next sections of the report.

The ultimate goal of the audit was to provide Hemi with a detailed summary of the findings, including any identified vulnerabilities, and recommendations to mitigate any discovered risks. The results of the audit are presented in detail further below.

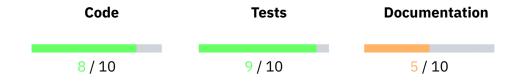

System Overview

The Hemi token is a ERC20 token with governance and gasless approval capabilities, initially minting 10B tokens. It implements monthly token emissions based on configurable annual inflation rate and automatically bridges all newly tokens to L2 through a tunnel system with configurable destination addresses.

Repository Coverage and Quality

Resonance's testing team has assessed the Code, Tests, and Documentation coverage and quality of the system and achieved the following results:

- The code follows development best practices and makes use of known patterns, standard libraries, and language guides. It is easily readable and uses the latest stable version of relevant components. Overall, **code quality is, good**.
- Unit and integration tests are included. The tests cover both technical and functional requirements. Code coverage is 90%. Overall, **tests coverage and quality is excellent**.
- The documentation only includes the specification of the system. Overall, **documentation coverage and quality is average**.

Target

The objective of this project is to conduct a comprehensive review and security analysis of the smart contracts that are contained within the specified repository.

The following items are included as targets of the security assessment:

- Repository: hemilabs/hemi-token
- Hash: 8e3988b6ad1372ce0306161bd6418bb8615dc645

The following items are excluded:

- External and standard libraries
- Files pertaining to the deployment process
- Financial related attacks

Methodology

In the context of security audits, Resonance's primary objective is to portray the workflow of a real-world cyber attack against an entity or organization, and document in a report the findings, vulnerabilities, and techniques used by malicious actors. While several approaches can be taken into consideration during the assessment, Resonance's core value comes from the ability to correlate automated and manual analysis of system components and reach a comprehensive understanding and awareness with the customer on security-related issues.

Resonance implements several and extensive verifications based off industry's standards, such as, identification and exploitation of security vulnerabilities both public and proprietary, static and dynamic testing of relevant workflows, adherence and knowledge of security best practices, assurance of system specifications and requirements, and more. Resonance's approach is therefore consistent, credible and essential, for customers to maintain a low degree of risk exposure.

Ultimately, product owners are able to analyze the audit from the perspective of a malicious actor and distinguish where, how, and why security gaps exist in their assets, and mitigate them in a timely fashion.

Source Code Review - Solidity EVM

During source code reviews for Web3 assets, Resonance includes a specific methodology that better attempts to effectively test the system in check:

- 1. Review specifications, documentation, and functionalities
- 2. Assert functionalities work as intended and specified
- 3. Deploy system in test environment and execute deployment processes and tests
- 4. Perform automated code review with public and proprietary tools
- 5. Perform manual code review with several experienced engineers
- 6. Attempt to discover and exploit security-related findings
- 7. Examine code quality and adherence to development and security best practices
- 8. Specify concise recommendations and action items
- 9. Revise mitigating efforts and validate the security of the system

Additionally and specifically for Solidity EVM audits, the following attack scenarios and tests are recreated by Resonance to guarantee the most thorough coverage of the codebase:

- Reentrancy attacks
- Frontrunning attacks
- Unsafe external calls
- Unsafe third party integrations
- Denial of service
- Access control issues

- Inaccurate business logic implementations
- Incorrect gas usage
- Arithmetic issues
- Unsafe callbacks
- Timestamp dependence
- Mishandled panics, errors and exceptions

Severity Rating

Security findings identified by Resonance are rated based on a Severity Rating which is, in turn, calculated off the **impact** and **likelihood** of a related security incident taking place. This rating provides a way to capture the principal characteristics of a finding in these two categories and produce a score reflecting its severity. The score can then be translated into a qualitative representation to help customers properly assess and prioritize their vulnerability management processes.

The **impact** of a finding can be categorized in the following levels:

- 1. Weak Inconsequential or minimal damage or loss
- 2. Medium Temporary or partial damage or loss
- 3. Strong Significant or unrecoverable damage or loss

The **likelihood** of a finding can be categorized in the following levels:

- 1. Unlikely Requires substantial knowledge or effort or uncontrollable conditions
- 2. Likely Requires technical knowledge or no special conditions
- 3. Very Likely Requires trivial knowledge or effort or no conditions

Repository Coverage and Quality Rating

The assessment of Code, Tests, and Documentation coverage and quality is one of many goals of Resonance to maintain a high-level of accountability and excellence in building the Web3 industry. In Resonance it is believed to be paramount that builders start off with a good supporting base, not only development-wise, but also with the different security aspects in mind. A product, well thought out and built right from the start, is inherently a more secure product, and has the potential to be a game-changer for Web3's new generation of blockchains, smart contracts, and dApps.

Accordingly, Resonance implements the evaluation of the code, the tests, and the documentation on a score **from 1 to 10** (1 being the lowest and 10 being the highest) to assess their quality and coverage. In more detail:

- Code should follow development best practices, including usage of known patterns, standard libraries, and language guides. It should be easily readable throughout its structure, completed with relevant comments, and make use of the latest stable version components, which most of the times are naturally more secure.
- Tests should always be included to assess both technical and functional requirements of the system. Unit testing alone does not provide sufficient knowledge about the correct functioning of the code. Integration tests are often where most security issues are found, and should always be included. Furthermore, the tests should cover the entirety of the codebase, making sure no line of code is left unchecked.
- Documentation should provide sufficient knowledge for the users of the system. It is useful for developers and power-users to understand the technical and specification details behind each section of the code, as well as, regular users who need to discern the different functional workflows to interact with the system.

Findings

During the security audit, several findings were identified to possess a certain degree of security-related weaknesses. These findings, represented by unique IDs, are detailed in this section with relevant information including Severity, Category, Status, Code Section, Description, and Recommendation. Further extensive information may be included in corresponding appendices should it be required.

An overview of all the identified findings is outlined in the table below, where they are sorted by Severity and include a **Remediation Priority** metric asserted by Resonance's Testing Team. This metric characterizes findings as follows:

- "Quick Win" Requires little work for a high impact on risk reduction.
- "Standard Fix" Requires an average amount of work to fully reduce the risk.
- "Heavy Project" Requires extensive work for a low impact on risk reduction.

annualInflationRate Could Block Protocol If Set To

High

RES-HEMI-TOK01 Data Validation Resolved

Code Section

• src/Hemi.sol#L134

Description

The global variable annualInflationRate is used to adjust the amount when new tokens are minted after the last issuance.

The owner can only adjust the value downwards, as it is not allowed to use a higher current value.

In case the owner mistakenly sets 0 as the value of this variable, it would not be possible to mint new tokens, since <code>_emissionAmount</code> in <code>calculateEmission()</code> would always be 0.

Recommendation

It is recommended to add a measure to avoid blocking minting of new tokens if annualInflationRate becomes 0.

Status

annualInflationRate Does Not Have Upper or Lower Limit

Medium

RES-HEMI-TOK02 Data Validation Resolved

Code Section

• src/Hemi.sol#L55

Description

The annualInflationRate does not have any upper or lower limit in the constructor(). This may block the protocol or cause a bad experience for users if an incorrect value is indicated.

Recommendation

It is recommended to add lower and upper limits to variables that affect to the amount minted tokens to avoid inappropiate behavior of the protocol.

Status

Lack of Token Distribution Leads to Centralization Problems

Low

RES-HEMI-TOK03

Business Logic

Acknowledged

Code Section

• src/Hemi.sol#L57

Description

If an address holds most of the total supply of a token, potential consequences arise. Centralization problems would appear, since a small group controls a large portion of the tokens. Market manipulation problems could emerge too, because volatility could be artificially increased. Finally, there would be a decrease in trust and confidence in the project if the tokens are not distributed more equitably.

Recommendation

If it is not possible to mint new tokens by the users and only one address will be in charge of distributing them, it is recommended to add to documentation the distribution system that will be followed by the protocol.

Status

The issue has been marked as acknowledged with the comment "There will be documentation on it".

Centralization Risk For Trusted Owners

Low RF

RES-HEMI-TOK04

Access Control

Acknowledged

Code Section

• src/Hemi.sol

Description

The protocol contains several functions access controlled by owners with privileged rights in charge of performing admin tasks like setting the proxy or setting fees. These owners need to be trusted to not perform malicious updates on the protocol.

Recommendation

It is recommended to implement solutions like a multi-signature wallet to distribute admin control among multiple trusted parties. This ensures that critical actions can only be executed if a predefined quorum of trusted parties approves the action, reducing the risk of unilateral decisions or key compromise.

Status

The issue has been marked as acknowledged with the comment "There will be multisig owner".

Update Import Usages To Add Modularity

Info

RES-HEMI-TOK05 Code Quality Resolved

Code Section

• src/Hemi.sol

Description

Two different syntaxes for importing contracts from external libraries or dependencies are used in Solidity:

- 1. import "@openzeppelin/contracts/token/ERC20/ERC20.sol";
- 2. import {ERC20} from "@openzeppelin/contracts/token/ERC20/ERC20.sol"

Second syntax allows developers to selectively import specific contracts from a file and provides finer control over which contracts are being imported. This could be useful for reducing namespace clutter or importing only necessary code for the contract.

Recommendation

It is recommended to update imports with curly braces usage if possible.

Status

Floating Pragma

Info

RES-HEMI-TOK06 Code Quality Resolved

Code Section

• src/Hemi.sol

Description

The project uses floating pragmas ^0.8.28.

This may result in the contracts being deployed using the wrong pragma version, which is different from the one they were tested with. For example, they might be deployed using an outdated pragma version which may include bugs that affect the system negatively.

Recommendation

It is recommended to use a strict and locked pragma version for solidity code. Preferably, the version should be neither too new or too old.

Status

Proof of Concepts

No Proof-of-Concept was deemed relevant to describe findings in this engagement.
